

ALAIN ROY FRANCISCO

Senior Software Engineer | 10+ Years Building Scalable Applications Through Strong Teamwork

Pasig, PH | +639175322814 | armfrancisco@gmail.com | [arfrancisco](#) | [alainfrancisco](#)

SUMMARY

Software Engineer with 10+ years of experience designing, building, and maintaining scalable, high-quality applications. Skilled in translating business requirements into technical solutions that deliver measurable results. Brings a balance of hands-on development and leadership, including mentoring teams and guiding projects to success, and has adapted to AI-assisted development practices, emphasizing planning and verification alongside traditional engineering skills. Strong communicator and collaborative team player with a focus on delivering value.

SKILLS

Backend: Ruby on Rails (API & monolith), RESTful services, GraphQL

Frontend: ES6+, React, JavaScript, HTML, CSS

Database: MySQL, PostgreSQL

Version Control: Docker, CI/CD, Git

Testing: RSpec, CI/CD

AI Engineering: Claude, AI-Assisted Development, Harness Engineering, Planning & Verification-Driven Workflows

Others: Agile, Mentoring, Technical Decision-Making, Project Management

EXPERIENCE

Lavanda

Senior Software Engineer

2025-2026

London, UK

- Collaborated closely with other development teams to build new features while maintaining and supporting existing systems. Led firefighting efforts on reporting issues, ensuring the values shown to customers were up to date, accurate, and correct.
- Upskilled on Claude and AI-assisted development, shifting from a traditional coding-focused mindset to a harness engineering approach centered on planning and verification rather than manual implementation, in order to keep pace with changing engineering practices.

Helping Group

Senior Software Engineer

2023-2025

Berlin, DE

- Worked closely with product owners to evaluate the feasibility, impact, and value of proposed features, as part of a cross-functional squad of 5 engineers, a product owner, and a QA engineer that also coordinated with roughly 4 other development teams. Proactively challenged assumptions and provided accurate effort estimations to help with decision making. Created comprehensive technical documentation to support clarity and provide a reliable source of truth.
- Defined implementation strategies focused on scalability and maintainability. Helped establish coding standards to improve efficiency and reduce technical debt. Actively supported and mentored team members, resolving blockers and fostering a culture of collaboration.
- As senior engineer, focused primarily on design, architecture, and testing and QA strategy for new pricing and promotions features rather than hands-on coding, weighing build effort against potential value before committing the team to the work.
- Built observability into pricing and promotions releases so feature impact could be verified in production after launch, rather than assumed.

Radiant Law

Senior Software Engineer

2021-2024
Cape Town, SA

- As the sole developer for most of the engagement, I took on the challenge of transforming a fragile, monolithic codebase that was rushed to production with no tests, documentation, or clear structure. The original author was no longer with the company, and the system was an internal tool used by roughly 20 to 30 people, which let me work directly with users to understand critical workflows before planning any refactor.
- Prioritized and refactored core components, restructured the codebase for maintainability, and introduced end-to-end test coverage that was previously near nonexistent, significantly improving stability and developer onboarding while simultaneously delivering new features and fixing critical bugs.
- Owned infrastructure end-to-end as the sole developer, including architecture, scaling, and monitoring, and led a full migration of the application's infrastructure from Heroku to Google Cloud Platform.
- Ahead of transitioning the codebase to an external Ruby consultancy near the end of the engagement, used GitHub Copilot and Claude Code as an early step into AI-assisted development to accelerate understanding of the aging monolith and build out missing documentation and convention guidelines to support the handoff.

Launchpad Recruits

Software Engineer

2018-2023
London, UK

- Joined the team to address major performance issues caused by heavy database operations and slow page rendering, and actively participated in architectural discussions to separate the frontend from the backend.
- Contributed to the adoption of React.js for the UI and GraphQL as the API layer, then took primary responsibility for converting existing views to React.js and implementing GraphQL endpoints.
- Created technical documentation to support the new architecture and collaborated closely with stakeholders to prioritize components for migration, ensuring minimal disruption to daily operations.

Cohort Solutions

Software Developer

2016-2018
Brisbane, AU

- Worked remotely with a Brisbane based team, building and maintaining a secure live payment app in Ruby on Rails and React.
- Had no prior React experience joining the project, but ramped up quickly and delivered features under a strict peer review process.

Clinic-IT

Software Developer

2011-2016
New York, US

- Joined as part of a small pioneer team with no standards or processes in place, and helped establish coding practices, peer reviews, and procedures for the group.
- Retrofitted legacy applications for stability while wearing multiple hats across DevOps, tech support, and development, building strong technical expertise and a solid work ethic along the way.
